

Lesson #4b: Factoring Trinomials

Learning Goal: We are learning to factor more complicated trinomials.

Let's add another wrinkle to our lesson and try factoring some more complicated trinomials. Maybe some of these can't even be factored at all! <duh duh duh!!!!>

Factor each completely.

1) $5n^2 + 47n - 30$

$M: -150$
 $A: 47$

$-1, 150$
 $-3, 75$
 $-3, 50$

$= 5n^2 + 50n - 3n - 30$

$= (5n - 3)(n + 10)$

Show one more step if you want to.

2) $9k^2 + 8k + 8$

unfactorable.

$M: +72$

$A: +8$

$1, 72 = 73$

$2, 36 = 39$

$3, 24 = 27$

$4, 18 = 22$

$6, 12 = 18$

$8, 9 = 17$

✱ Always look for a common factor.

3) $3a^2 - 18a - 48$

$= 3(a^2 - 6a - 16)$ $M: -16$
 $A: -6$ $\boxed{2, -8}$

$= 3(a^2 + 2a - 8a - 16)$

$= 3(a(a+2) - 8(a+2))$ skip from con.

$= 3(a+2)(a-8)$

4) $24k^2 - 100k + 56$

$= 4(6k^2 - 25k + 14)$ $M: 84$
 $A: -25$

$= 4(6k^2 - 4k - 21k + 14)$ $-1, -84$
 $-2, -42$

$= 4(2k - 7)(3k - 2)$ $-3, -28$
 $\boxed{-4, -21}$

5) $9a^2 - 16$

$= 9a^2 + 0a - 16$

$M: -144$
 $A: 0$

$+12, -12$

$= 9a^2 - 12a + 12a - 16$
 $3a \quad +4$

$= 3a(3a-4) + 4(3a-4)$

$= (3a-4)(3a+4)$

6) $25b^2 - 90b + 81$

$M: 2025$

$A: -90$

$= 25b^2 - 45b - 45b + 81$
 $5b \quad -9$

$= 5b(5b-9) - 9(5b-9)$ $-1, -2025$
 $-3, -675$

$= (5b-9)(5b-9)$ $-5, -405$

$= (5b-9)^2$

$-45, -45$

Success Criteria

- I can set up my factoring by finding a factor pair that multiplies to the first and last terms ($A \times C$), but adds to the middle term (B).
- I can use "Factoring by Decomposition" to factor a trinomial
