Math 9 – Unit 2: Algebra One Name: _____

Lesson #1: Collecting Like Terms Date: _____

In this unit, you will be introduced to one of the most important component to Mathematics: Algebra. Algebra comes from the Arabic word *"al-jabr"*, meaning "the coming together of broken parts", and math is about bringing together ideas to solve problems. In Algebra, we will look at how to use Mathematical symbols and the rules for manipulating them. Typically, the symbols are letters.

Learning Goal: We are learning common math terminology, and using those terms to simplify algebraic expressions.

To begin, let's define some terminology that is important in Algebra.

Expression:

Variable:

Coefficient:

Constant:

Like terms:

Unlike terms:

Example: Given the following expressions, state the number of terms, the coefficients, and the constant term.

a) $3x^2 - 5x + 7$

b) $-5y + 10x + 8 - 12y$

In the above example, the second expression has 4 terms, but two of them had the same variable. This means that we can combine them together. All you need to do is add, or subtract, their coefficients. This process is called collecting like terms.

Collect the like terms in the above example: $-5y + 10x + 8 - 12y$

More examples:

a) $-6 - 3r^2 - 4r + 2 + 6r$

b) $-4k^3 - 8k^2 + 4 + 7k^4 - k^3 - 8k^2 - 1$

c) $7a^2b^2 + 2a^4 - 8a^3b^3 - 4a^2b - 2a^4 - 2a^3b^3 + 8a^2b^2$

Now for a super duper big example:

d) $-8x - x^2y^2 - 8x^3y^5 + 3x^3y + 2x^3y + 6x + 2x^2y^2 + 2xy - 2x^2y^2 + 5x^3y^4 + 3xy + 5x$

There's more! Did you ask, "what term should I write first?" If you did, good thinking! There is a definite order to writing out expressions. It is called descending order.

Descending order is:

Now go back to the above examples and put them in descending order.

When an expression is simplified, we call that a _____, meaning _____ _____. However, we also have special names for expressions with one, two, or three terms.

$4x^2$ is called a _____.

$3x^5 - 2xy$ is called a _____.

$7y^2 + 5y - 1$ is called a _____.

Anything over that we just call a _____.

Finally, all polynomials have a degree, which is just the _____.

Examples: For each expression, collect the like terms, state what type of polynomial, and the degree.

a) $-2v-2v^5-8+2v^5+7v$

b) $3xy-4x^2y+8x^4y+6xy-7x^2y-7x^4y$

c) $\frac{7}{4}x^5-\frac{2}{3}x^4-\frac{4}{3}x^4+\frac{6}{7}x^5$

Success Criteria:

- I can correctly define the following terms: expression, variable, coefficient, constant, like term, unlike term, monomial, binomial, trinomial, polynomial, and degree
- I can group like terms within algebraic expressions
- I can identify the degree and type of various polynomials
