

Thursday and Friday: In class assignment

↳ Mostly 3.5

↳ a little bit of 3.6 + 3.8

↳ all questions must be completed in class

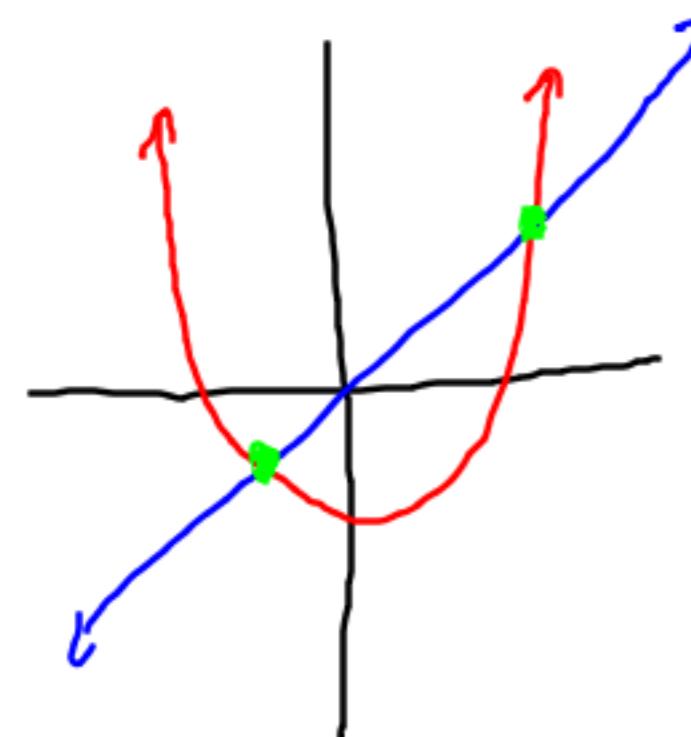

↳ you may use all your notes + textbook + others.

↳ your work must be your own, No copying!!

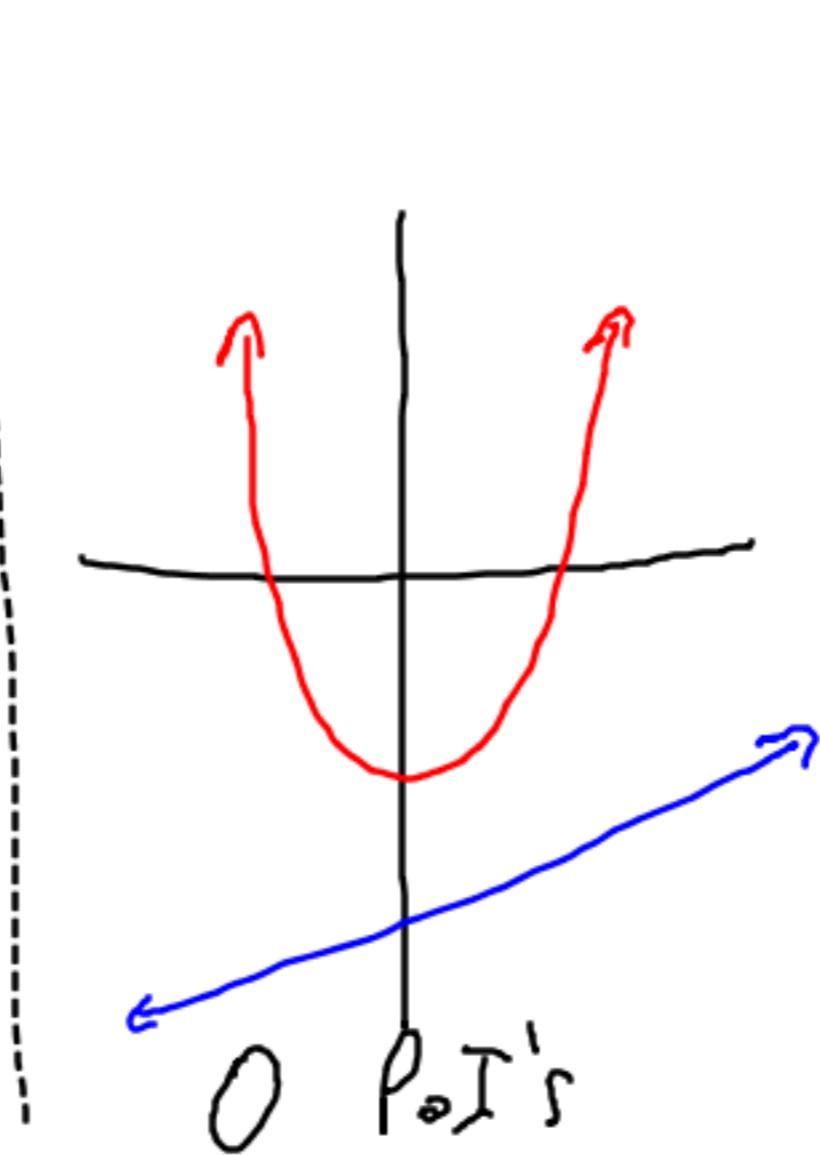

3.8

## Linear - Quadratic Systems:

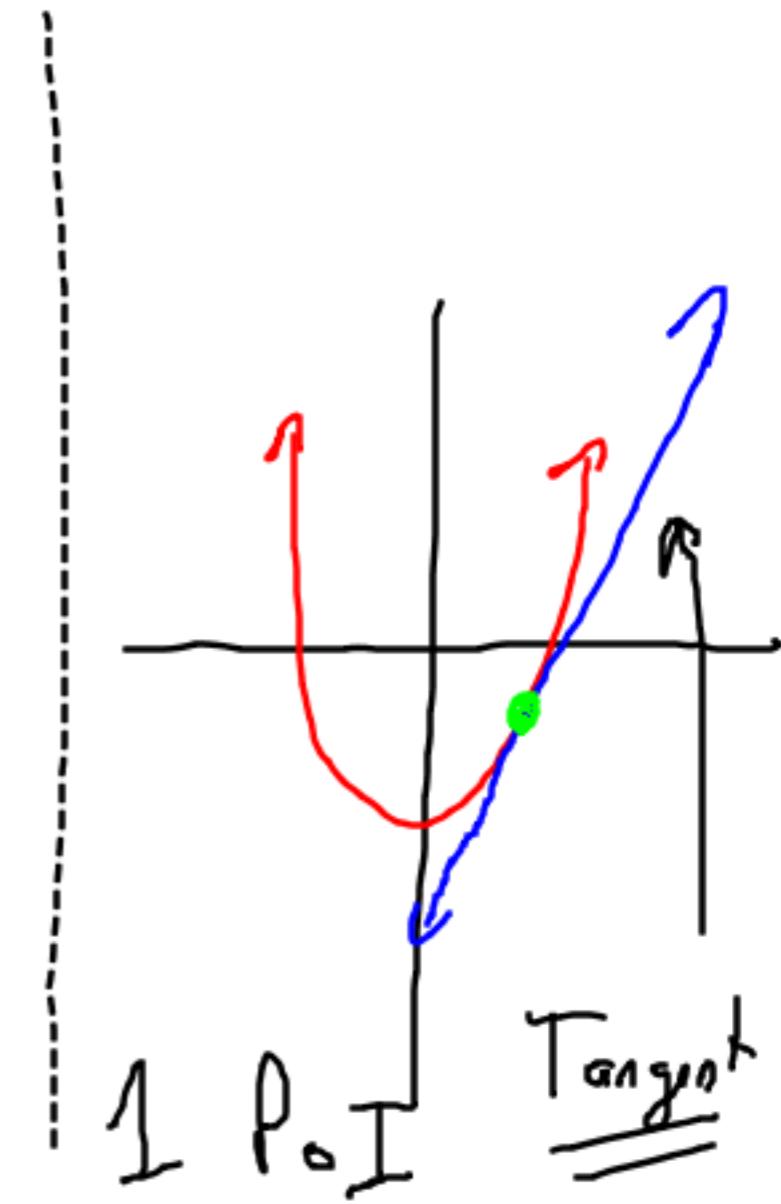

When a line and parabola meet. There are  
3 possibilities:

Two P.o.I's

0 P.o.I's

1 P.o.I

Tangent

$$f(x) = 3x + 5$$

$$g(x) = 2x^2 - 3x - 4$$

Find how many PoI's there are.

$$f(x) = g(x)$$

$$3x + 5 = 2x^2 - 3x - 4$$

$$0 = 2x^2 - 6x - 9$$

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

$$b^2 - 4ac = (-6)^2 - 4(2)(-9)$$

$$\therefore b^2 - 4ac > 0$$

$$= 36 + 72$$

$\therefore$  2 PoI's

$$= 108$$

Find the PoI's of  $f(x)$  and  $g(x)$ .

$$2x^2 - 6x - 9 = 0$$

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

$$x = \frac{6 \pm \sqrt{108}}{2(2)}$$

$$x = \frac{6 \pm 10.4}{4}$$

$$x = \frac{6 + 10.4}{4} = 4.1$$

and

$$x = \frac{6 - 10.4}{4} = -1.1$$

Finally, find the y's. (use the linear  $f^{-1}$ )

$$f(x) = 3x + 5$$

$$f(4.1) = 3(4.1) + 5$$

$$f(4.1) = 17.3$$

$$(4.1, 17.3)$$

$$f(-1.1) = 3(-1.1) + 5$$

$$f(-1.1) = 1.7$$

$$(-1.1, 1.7)$$

$$\text{Let } f(x) = 2x + k \quad g(x) = 3x^2 + 5x - 2$$

Find the value of  $k$  so that  $f(x)$  and  $g(x)$  intersect only once.

$$f(x) = g(x)$$

$$2x + k = 3x^2 + 5x - 2$$

$$0 = 3x^2 + 3x - 2 - k$$

$$0 = \underset{a}{3x^2} + \underset{b}{3x} - \underset{c}{2-k}$$

$$b^2 - 4ac = 0$$

$$3^2 - 4(3)(-2-k) = 0$$

$$9 - 12(-2-k) = 0$$

$$9 + 24 + 12k = 0$$

$$12k = -33$$

$$k = \frac{-33}{12} = \frac{-11}{4} = -2.75$$
