Hole Check

3. A ball is moving through space and its **position** is described by the function $s(t) = -4.9t^2 + t + 5$. Determine the ball's **velocity** at times t = 0, 2, 3 seconds. (Hint: it's easiest if you find velocity as a function of time).

$$S'(t) = \lim_{h \to \infty} \left(\frac{S(t+h) - S(t)}{h} \right)$$

$$=\lim_{h\to \infty}\left(-9.8th-4.9h^2+h\right)$$

ie velocity is
$$v(t) = -9.8111$$

$$S(t) = \frac{dS}{dt} = V(t)$$

Change in position the change in time

$$V(0) = 1 \text{ m/sec}$$

$$2 + t = 2 \qquad V(2) = -9.8(2) + 1 = -13.6 \text{ m/sec}$$

$$2 + t = 3 \qquad V(5) = -9.8(3) + 1 = -28.4 \text{ m/sec}$$

4. Determine the equation of the tangent to the function
$$g(x) = \sqrt{x-1}$$
, and which is parallel to the line with equation $y = \frac{1}{4}x - 1$.

tangent = derivative | we want our derivative =
$$\frac{1}{4}$$

$$g(x) = \lim_{h \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{h \to \infty} \left(\frac{\sqrt{x+h-1} - \sqrt{x-1}}{h} \right)$$

$$= \lim_{h \to \infty} \left(\frac{\sqrt{x+h-1} - \sqrt{x-1}}{h} \right)$$

(Me derivative is a slope finding for
we want
$$g(n) = 4$$
)

$$\Rightarrow \int_{A} = \sum_{\lambda=1}^{\infty}$$

(so of the point
$$(5, g/5)$$
) = $(5, 2)$ the largest has

i. The egs of the toment is y = mx + b, $m = \frac{1}{4}$ of the point (5,2)D y = 4 >1 + b $2 = \frac{1}{4}(t) + \frac{1}{5}$ $3 = \frac{3}{4}(t) + \frac{1}{5}(t) + \frac{1}{5}(t)$ $4 = \frac{1}{4}(t) + \frac{1}{5}(t)$ i. $\sqrt{z} + 2 + 3 + 4$ $\left(x - 4y + 3 = 0 \right)$ is standard form)

2.2 Derivatives of Polynomial Functions

Using the "formal" definition of the derivative

can be painful and tedious. Mathematicians, always wanting to reduce pain and tedium develop rules to simply our work. And we will spend a bit of time learning the rules, and how to use them.

The Derivative of a Constant Function

Given
$$f(x) = k$$
, then $f'(x) = 0$

Proof:

32

$$f(x) = \lim_{h \to \infty} \left(\frac{f(x+h) - f(x)}{h} \right)$$

$$= \lim_{h \to \infty} \left(\frac{k - k}{h} \right)$$

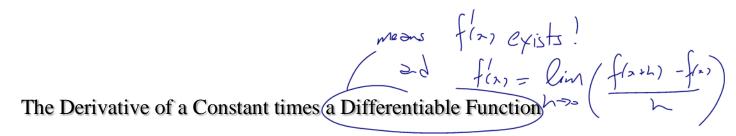

$$= \lim_{h \to \infty} \left(\frac{O}{h} \right)$$

$$= \lim_{h \to \infty} \left(\frac{O}{h} \right)$$

KEEP IN MIND

The derivative is a TOOL for measuring rate of change. In terms of algebraic functions, the derivative calculates the slope of tangents.

(ig derivoliver measure rste of change!)

Given a differentiable function, f(x), then, the function $g(x) = k \cdot f(x)$, k constant, is also differentiable, and $g'(x) = k \cdot f'(x)$.

Proof:

$$g(x) = \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}{h} \right)$$

$$= \lim_{n \to \infty} \left(\frac{g(x+h) - g(x)}$$

The Derivative of a Power Function (*The Power Rule*)

Given a power function $f(x) = x^n$, then f(x) is differentiable and $f'(x) = n \cdot x^{n-1}$ (See pg. 77 for a proof, which requires knowledge of the Binomial Theorem)

The Power Rule says:

"Bring the exponent down, and reduce the exponent by 1"

Example 2.2.1

Differentiate

a)
$$f(x) = x^3$$

$$\int_{(\lambda)}^{1} = 3\lambda^{2}$$

b)
$$g(x) = x^{-4-1} = x^{-5}$$
 c) $h(x) = x^{\frac{2}{5}}$ $\frac{2}{5} - 1 = \frac{2}{5} - \frac{1}{5} = \frac{2}{5} - \frac{1}{5$

$$g'(x) = -4x^{-5}$$

$$c) h(x) = x^{\frac{2}{5}}$$

$$h(x) = \frac{2}{5}x^{-3/5}$$

d)
$$f(x) = 7x^4$$
 by e) $g(x) = x^4$

$$f(x) = 7(x^{2})$$

$$= 7(x^{2})$$

g)
$$f(x) = \pi x^5$$

e)
$$g(x) = x$$

$$h) g(x) = \frac{3}{x^6}$$

$$= 23 x^{3}$$
g) $f(x) = \pi x^{5}$
h) $g(x) = \frac{3}{x^{6}}$
while as = part
$$\int_{-\infty}^{\infty} (x) = x^{3}$$

$$\int_{-\infty}^{\infty} (x) = x^{3}$$

$$\int_{-\infty}^{\infty} (x) = x^{3}$$

$$\int_{-\infty}^{\infty} (x) = -18x^{3}$$

$$\int_{-\infty}^{\infty} (x) = -18x^{3}$$

$$= \frac{1}{3}x^{3}$$

$$\left(= \frac{-18}{\lambda^7} \right)$$

f)
$$h(x) = -6x$$

i)
$$h(x) = \sqrt[3]{x}$$

$$N(x) = x^{\frac{1}{3}}$$

The Derivatives of Sums and Differences of Differentiable Functions

Given differentiable functions f(x) and g(x), then the functions

$$F(x) = f(x) + g(x)$$
, and

$$G(x) = f(x) - g(x)$$

are also differentiable and

$$F'(x) = f'(x) + g'(x), \text{ and}$$

$$G'(x) = f'(x) - g'(x)$$

See page 79 for the simple proofs of these results.

Example 2.2.2

Differentiate
$$f(x) = 3x^3 - 4\sqrt{x} + \frac{7}{x^2}$$
 rewrite at power $\int_{-\infty}^{\infty} x^3 dx = \int_{-\infty}^{\infty} (2x)^2 dx = \int_{-$

Example 2.2.3

Differentiate
$$g(x) = \frac{7x^2 - 5x^3 + 8x}{\sqrt{x}}$$
 this is common to each term in the numerator!

Differentiate
$$g(x) = \frac{7x^2 - 5x^3 + 8x}{\sqrt{x}}$$
 this is common to each term in the numerator!

Fraction $g(x) = \frac{7x^2 - 5x^3 + 8x}{\sqrt{x}}$ the numerator!

 $2 - \frac{1}{2} = \frac{7x^2}{x^{\frac{1}{2}}} - \frac{5x^3}{x^{\frac{1}{2}}} + \frac{8x}{x^{\frac{1}{2}}}$ rewrite $g(x) = 5$ a sum/difference of year $\frac{1}{2}$ and $\frac{1}{2}$ and

Class/Homework for Section 2.2 Pg. 82 – 84 #2 – 4, 6, 7, 9, 11 – 14, 16, 18, 21, 23, 25
