

# Advanced Functions

## Chapter 2 – Polynomial Functions

Fall 2013

### Course Notes

(Note: *This material is taken from [Chapter 3](#) in the textbook*)

# Chapter 2 – Polynomial Functions

*Contents with suggested problems from the Nelson Textbook (Chapter 3)*

## **2.1 Polynomial Functions: An Introduction – Pg 30 - 32**

Pg. 122 #1 – 3 (Review on Quadratic Factoring)

Pg. 127 – 128 #1, 2, 3cd, 5, 6

## **2.2 Characteristics of Polynomial Functions – Pg 33 – 38**

Pg. 136 - 138 #1 – 5, 7, 8, 10, 11

## **2.3 Zeros of Polynomial Functions – Pg 39 – 43**

READ ex 3, 4, 5 on Pg 141 - 144

Pg. 146 - 148 #1 2, 4, 6, 8ab, 10, 12, 13b

## **2.4 Dividing Polynomials – Pg 44 - 51**

Pg. 168 - 170 #2, 5, 6acdef, 10acef, 12, 13

## **2.5 The Factor Theorem – Pg 52 – 54**

Pg. 176 - 177 #1, 2, 5 – 7 abcd, 8ac, 9, 12

## **2.6 Sums and Differences of Cubes – Pg 55 – 56**

Pg 182 #2aei, 3, 4

## 2.1 Polynomial Functions: An Introduction

### Definition 2.1.1

A **Polynomial Function** is of the form

$$f(x) = a_n x^n + a_{n-1} x^{n-1} + a_{n-2} x^{n-2} + \dots + a_2 x^2 + a_1 x + a_0$$

where  $a_i, i=0,1,2,\dots,n$  are called coefficients,  $a_i$  are real numbers (but for us,  $a_i$  will usually be integers)  
and ' $n$ ' will be a Natural Number  $\mathbb{N} = \{1, 2, 3, \dots\}$  (the naturals are the counting numbers)

Examples of Polynomial Functions

a)  $f(x) = 8x^4 - 5x^3 + 2x^2 + 3x - 5$

$$a_4 = 8, a_3 = -5, a_2 = 2, a_1 = 3, a_0 = -5$$

b)  $g(x) = 7x^6 - 4x^3 + 3x^2 + 2x$

$$a_6 = 7, a_5 = 0, a_4 = 0, a_3 = -4, a_2 = 3, a_1 = 2, a_0 = 0$$

there are zero " $x^5$ 's and " $x^4$ 's"

Notes: The **TERM**  $a_n x^n$  in any polynomial function (where  $n$  is the highest power we see) is called the **LEADING TERM**, and then we write all the following terms in **descending order**.

The **Leading Term** has two components:

- 1) Leading Coefficient  $a_n$ . Note  $a_n$  could be +ve or -ve
- 2)  $n$ . Note  $n$  can be even or odd

The **Leading Term** tells us the **end behaviour** of the polynomial function.

Pictures

$a_n > 0$   
 $n$  even

$a_n < 0$   
 $n$  even

$a_n > 0$   
 $n$  odd

$a_n < 0$   
 $n$  odd

**Definition 2.1.2** <sup>degree</sup>

The **order** of a polynomial is

the value of the 'power' on the leading term.

eg  $f(x) = -2x^8 - 5x^6 + 2x - 5$  is an

order 8  
(or degree 8)  
polynomial

**Finite Differences** (between successive functional values) can tell us the order of a polynomial:

$x$	$f(x)$	1 <sup>ST</sup> F.D.	2 <sup>ND</sup> F.D.	3 <sup>RD</sup> F.D.	...
-1	-1				
0	0	1	0	6	
1	1	1	6		
2	8	7	12	6	
3	27	19			

Once you hit a constant finite difference that column gives the order of the polynomial fitting the "data". for above an order

3

polynomial describes  $f(x)$

Class/Homework for Section 2.1

Pg. 122 #1 – 3 (Review on Quadratic Factoring)

Pg. 127 – 128 #1, 2, 3cd, 5, 6
